Burden of Disease in North Rhine-Westphalia (BoD in NRW), part 1

Quantifying the health impacts of policies - principles, methods, and models
Düsseldorf, March, 16 – 17, 2010

C. Terschüren

19.04.2010

Key questions:

Effects of demografic change in NRW

- which effect has the demographic change in North Rhine – Westphalia on the burden of disease?
- 2025: which diseases are contributing which proportion to burden of disease, resulting in needs in terms of health care?

Demographic change in NRW cont.

Characteristics:

- decrease in population : approx. -2.5% until 2025
- life expectancy in 2025: increased by 2 years

male newborns:	75.8 years (2004)		78.3 (2025)
female newborns:	81.3 years (2004)		83.5 (2025)

Myocardial infarction	I21-I23
Dementia	F00, F03, G30-G31

WHO approach adapted

Burden of disease = mortality +
disability due to morbidity

expressed as DALYs (Disability-Adjusted Life Years):

1 DALY = loss of 1 year lived in complete health

calculated as:

$$\text{DALY} = \text{YLL} + \text{YLD}$$

YLL = *years of life lost because of premature death*

YLD = *years of life lived with disability due to illness*

WHO approach adapted cont.

$$YLL = N \times (L - I)$$

YLL = years of life lost (due to premature death)

N = number of deaths in the population

L = life expectancy (by age group)

I = age at death

WHO approach adapted cont.

$$YLL = N \times (L - I)$$

N = number of deaths in the population

**data source: death statistics of NRW,
by administrative unit: county / major city**

I = *age at death (by age group)*

L = *life expectancy (by age group)*

WHO approach adapted cont.

$$YLD = I \times DW \times d$$

YLD = years lived with disabilities due to the disease

I = number of incident cases in the population

DW = *disability-weight*. disease specific

d = time period lived with disabilities [years]

➔ **DALY = YLL + YLD**

BoD prognosis of demographic change in NRW - Outlook

- prognoses of the development of burden of disease demonstrate large changes
- potentially associated with opportunities for considerable health gains via a range of preventive measures across different sectors
- initiate preparedness in health care for a higher number of patients of very old age
- (medical) therapies need to become more adjusted for patient of old age
- the prognoses will be used as baseline estimates in upcoming HIAs, with the effects of different interventions on health to be quantified accordingly

Thank you very much!

... and now I pass on to: EBD in NRW

Burdens of Disease in North Rhine-Westphalia (BoD in NRW), part 2: Environmental Tobacco Smoke (ETS)

before implementation of non-smoker-protection legislation

Claudia Hornberg, School of Public Health, University of Bielefeld

Reinhard Samson, School of Public Health, University of Bielefeld

Thomas Claßen, School of Public Health, University of Bielefeld

Odile C.L. Mekel, NRW Institute of Health and Work (LIGA.NRW)

Claudia Terschüren, NRW Institute of Health and Work (LIGA.NRW)

Rainer Fehr, NRW Institute of Health and Work (LIGA.NRW)

Background and objectives

Background:

- Non-smokers exposed to environmental tobacco smoke (ETS) indoors are at risk of the same acute and chronic illnesses (e.g., respiratory & cardiovascular diseases) as are smokers.
- Children are particularly sensitive to ETS.
- Prenatal exposure of a foetus if the mother smokes during pregnancy can have severe adverse healths effects.
- In 2008 legislation came into effect in NRW to protect non-smokers from ETS at the workplace, at recreational sites and inside public buildings.

Background and objectives

Objectives:

- Estimate the ETS-caused EBD in NRW under the conditions before 2008.
- Estimate the health gains expected from this legislation.
- Test the method developed by the WHO for assessing the **environmental burden of disease** (EBD) from ETS.

From BoD to comparative risk assessment (CRA) and environmental burden of disease (EBD)

Attributable cases - Health outcome X

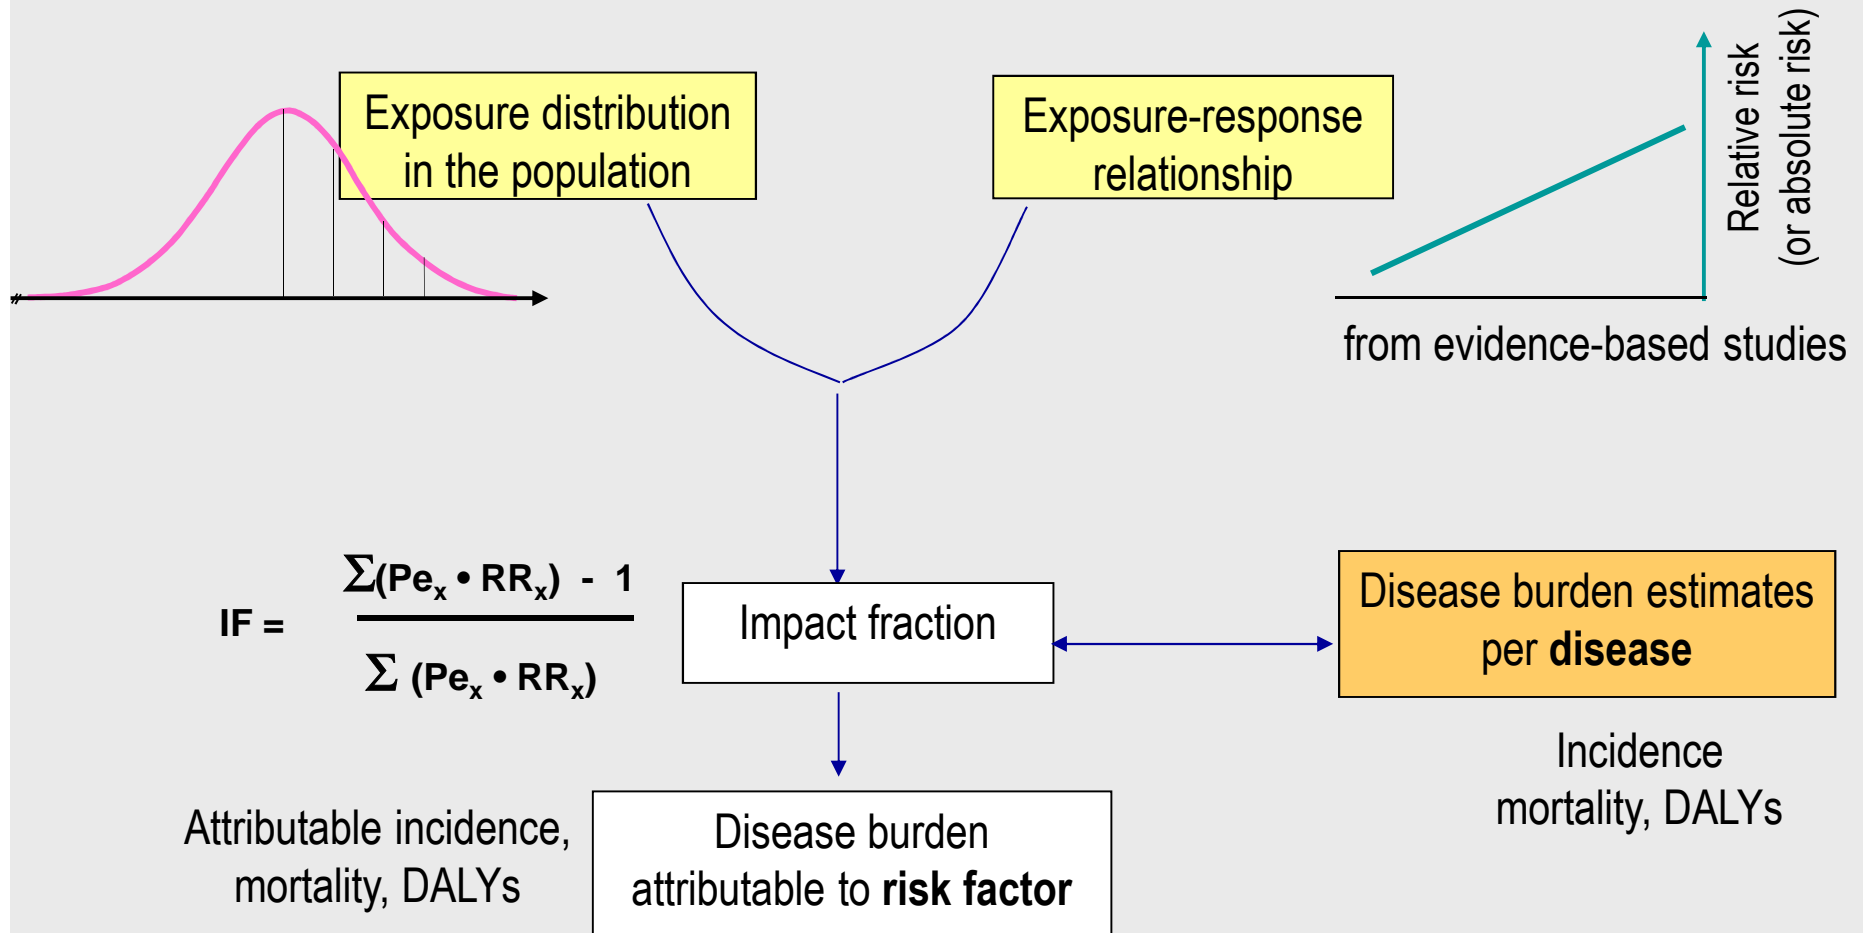

How to do EBD

- Specify **exposure**
- Define appropriate health outcomes
- Specify the **dose-response** relationships
- Derive **population baseline frequency** measures for the health outcomes (from morbidity and mortality statistics)
- Calculate the number of **attributable cases** in the target population
- Calculate DALYs attributable to a specific risk factor
- Calculate/assess potential **health gains** (scenarios)

Exposure-based approach in EBD

Assumptions for ETS exposure assessment I

- The **smoking prevalence** and **ETS exposure** in non-smokers was estimated from data of the
 - German Health Survey 2003
 - German Epidemiological Survey on addictions 2003 (self-assessments given through telephone interviews).

Limitations:

- Data about ETS exposure is **differentiated by site of exposure** (home, workplace, recreational facilities, other places), but the magnitude of exposure cannot be estimated due to survey design.
- Exposure can only be **assumed at home and at work** because exposure at recreational facilities and other places is irregular.

Assumptions for ETS exposure assessment II

- Smokers are also exposed to ETS, but the additional impact of ETS can be neglected because of the exceedingly high impact of smoking itself.
- Even being a former smoker by far exceeds the impact of ETS regarding lung cancer and COPD (chronic obstructive pulmonary disease).
- Foetal exposure is estimated from the smoking habits of the woman.

Prevalence of smoking

Age	Current smokers (%)		Current non-smokers (%)		Never smoked (%)		Former smokers (%)	
	M	F	M	F	M	F	M	F
20-29	54	43	46	57	31	42	69	58
30-39	45	37	55	63	33	39	67	61
40-49	43	36	57	64	26	38	74	62

Source: Telephone health survey 2003; Lampert, Burger 2005

ETS exposure of non-smoking men

ETS exposure of non-smoking women

Health outcomes

	ICD-10	Age groups	Population of non-smokers
Lung cancer	C33, C34	>20 years	Never smoked
Coronary heart disease (CHD)	I20-I24	>20 years	Never smoked & former smokers
COPD	J41-J44	>20 years	Never smoked and former smokers
Stroke	I60-I69	>20 years	Never smoked
Low birth weight	P07.0, P07.1	0 years	
Sudden infant death (SIDS)	C33, C34	<1 year	

Burden of disease (BoD) attributable to tobacco smoke: Assumptions

- **For children:**

Active smoking has a minor impact.

→ ETS is responsible for the total burden of disease due to tobacco smoke.

- **For adults:**

The BoD fraction attributable to ETS must be estimated by excluding the BoD due to active smoking.

BoD attributable to ETS (cases in 2004)

	Premature deaths	Incidence	Premature deaths	Incidence	Premature deaths	Incidence
Adults						
	Males		Females		Total	
Lung cancer	31	34	42	45	74	79

Sum	336	997	505	951	869	2770
Total Burden	31828	55116	31000	51986	62828	107102

BoD attributable to ETS in DALYs in 2004

	YLL	YLD	YLL	YLD	YLL	YLD	DALY	DALY/ Mio. inh.
Adults								
	Males		Women		Total			
Lung cancer	266	5	356	45	623	50	673	37,23
CHD	2032	847	1322	395	3353	1242	4596	254,24
COPD	31	89	58	113	89	202	291	16,10
Stroke	251	208	454	366	705	574	1279	70,76
Children								
Low birth weight					787		787	43,54
SIDS					98		98	5,42
Sum	2580	949	2190	909	5655	2068	7724	378,33

Health gains due to intervention

Assumption: eliminating ETS exposure at work

→ Reduction of DALYs by 26%

- **Limitations:**
- BoD attributable to ETS might be underestimated due to limitations of the study design.

Conclusions

- Legislation protecting non-smokers cannot directly influence the ETS exposure at home.
 - Further efforts are needed to reduce active smoking, especially amongst children and adolescents.
- Examples would include smoke-free schools and recreational facilities as well as other measures aimed at fighting the ubiquitousness of smoking.

Thank you for your attention!
